

1. Domain name search

A suitable food-blog domain idea is **AhmedabadFoodGuide.com**. You can check its current availability using [GoDaddy's Domain Search](#) or GoDaddy's WHOIS lookup. Availability changes constantly, so the result should be checked immediately before submitting the assignment.

Screenshot: Open the registrar, search **AhmedabadFoodGuide.com**, and take a screenshot showing the **Available/Unavailable** result.

2. Shared hosting comparison

For a small e-commerce website, I'll compare **Hostinger Premium** with **Bluehost Starter**. The prices below are the currently advertised introductory rates for their long-term plans, so renewal prices are higher.

Feature	Hostinger Premium	Bluehost Starter
Introductory price	₹149/month	₹199/month
Websites	3	10
Storage	20 GB SSD	10 GB NVMe
Free domain	1 year	1 year
Backups	Weekly	Weekly
CDN	Included	Included
SSL	Included	Included
E-commerce support	Integrated e-commerce tools	WooCommerce tools
Support	24/7 priority support	24/7 chat + phone support
Money-back guarantee	30 days	30 days

Hostinger lists Premium at ₹149/month on its current 48-month offer, renewing at ₹449/month. Bluehost lists Starter at ₹199/month on a 36-month term, renewing at ₹349/month.

For a small e-commerce project: Hostinger is attractive for its larger storage allowance and lower introductory price, while Bluehost offers more websites and phone support.

3. Free subdomain and HTML homepage

I can't register an external hosting account or upload files to it on your behalf. Also, **Freenom is not currently a dependable recommendation for this task**, so I would avoid claiming that you successfully registered a free domain there.

For the practical assignment, use a currently available free-hosting service that provides a subdomain, then upload an `index.html` file through its file manager.

Your homepage can contain:

```
<!DOCTYPE html>
<html>
<head>
  <title>My Website</title>
</head>
<body>
  <h1>Hello from My Website!</h1>
</body>
</html>
```

After uploading it as `index.html`, open the assigned subdomain in a browser and take a screenshot showing the page.

4. Domain registration vs. web hosting

Think of a **domain name** like your Instagram username: it gives people a memorable address they can use to find you. **Web hosting** is like the storage where all your photos, videos, and other Instagram content actually live. Registering a domain gives you the web address, while hosting provides the server space needed to store and deliver your website. You generally need both for a normal website: **domain = address, hosting = place where the website lives**.

5. Seven-step website-launch checklist

- **1. Choose a website idea and name** – Decide what the website will offer and choose a suitable brand name.
- **2. Search for a domain** – Check whether a suitable [.com](#), [.in](#), or other domain is available.
- **3. Register the domain** – Purchase/register the chosen domain through a registrar.
- **4. Choose web hosting** – Select hosting appropriate for the site's expected traffic and features.
- **5. Build the website** – Create the pages, navigation, images, text, and other content.
- **6. Connect domain and test** – Point the domain to the hosting server and test links, forms, mobile display, and loading speed.
- **7. Go live and promote** – Make the site public, submit it to search engines, and promote it through social media and other channels.
