

1. Product page – Amazon wireless headphones

For a typical **Amazon wireless-headphones product page**, these five on-page elements can support search visibility:

On-page element	Why it matters
Product title	Includes important terms such as “wireless headphones,” helping search engines understand the product.
Product description	Provides detailed, relevant information that can match searches for the product's features and uses.
Product images + alt text	Descriptive image information helps search engines understand visual content and improves accessibility.
Customer reviews	Fresh, product-specific text can provide additional useful content and match long-tail searches.
Internal links / related products	Helps search engines discover related pages and understand the site's overall structure.

Note: No single on-page element guarantees a higher ranking; Google uses many signals together.

2. Ranking factors for a food-delivery app

Ranking Factor	Importance for Zomato-style app	Why
Page speed	High	Fast pages provide a better user experience, especially on mobile devices.
Mobile-friendliness	High	Most food-delivery searches and orders happen on smartphones.
Keyword usage	High	Relevant terms such as “food delivery in Ahmedabad” help search engines understand pages.
Backlinks	High	Quality links from reputable websites can strengthen a site's authority.

User reviews Medium

Reviews provide useful, location-specific content and can support local visibility.

3. BookMyShow homepage – 3 possible SEO improvements

1. Improve location-specific content

Change: Create well-optimized landing pages for searches such as “**movies in Ahmedabad**”, “**movies in Mumbai**,” etc., with useful local information.

2. Strengthen page headings

Change: Use clear, descriptive **H1/H2 headings** around major sections such as movies, events, plays, and entertainment rather than relying mainly on visual banners.

3. Improve page performance

Change: Compress large movie/event images and lazy-load images that are below the initial screen to improve loading speed, particularly on mobile connections.

4. SEO checklist for an Instagram profile

- Use a **clear, searchable username** related to the brand/person.
- Include important **keywords in the profile name**.
- Write a keyword-rich but natural **bio**.
- Add a relevant **website link**.
- Use a recognizable **profile picture**.
- Create useful, descriptive **post captions**.
- Use relevant **hashtags** rather than unrelated popular hashtags.
- Add **location information** when the account represents a local business.
- Keep the profile **public and complete** so it can be discovered more easily.
- Encourage **engagement and shares**, which can increase the profile's overall visibility.

Two factors I didn't know before

★ **1. Keywords in the profile name:** I previously thought only the username mattered, but the searchable profile name can also help communicate what the account is about.

★ **2. Location information:** Adding a relevant location can help a local business become more discoverable for location-based searches.

Note: Instagram's internal search and Google's web search work differently, so these practices can improve discoverability but don't guarantee a Google ranking.
